

# SECURE YOUR NETWORK, PROTECT YOUR ORGANISATION

The more you access valuable data from mobile devices and non-enterprise networks the more you need to protect your organisation from hackers.

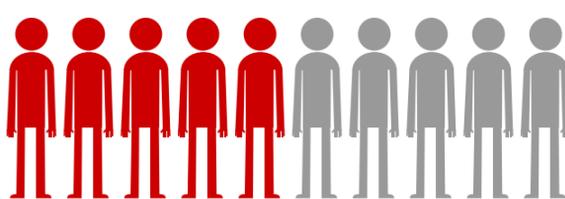

So having a smart, scalable, cost-effective security model in place to **protect you before, during, and after an attack is vital.**

## THE FACTS ABOUT SECURITY ATTACKS

**2014**  
**2015**

In 2015, security executives had less confidence in their IT security than in 2014.\*

**52%**

of enterprises have had to deal with security breaches.\*

**39%**

of enterprises claim that budgets are the biggest barrier to security upgrades.\*

## BEFORE AN ATTACK

### Prepare your network

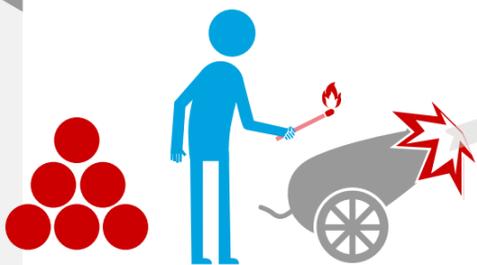

Cisco **ASA Next-Generation Firewalls (NGFW) with FirePower Services** protects against advanced threats, delivers superior multi-layered protection, improves visibility, and reduces security costs.

The Cisco **Identity Services Engine (ISE)** delivers greater user and device visibility to support enterprise mobility networks and access policies. **CDW is one of only a few partners in the UK to sell, design and implement ISE.**

## DURING A SECURITY ATTACK

### Continuously detect and block malicious activity

Cisco's **Next-Generation Intrusion Prevention System (NGIPS)** solutions detect, block and defend against network attacks which are in progress.

Cisco's **TrustSec** is embedded technology in switches, routers, and security devices helping to simplify and accelerate access control with software-defined segmentation.

## AFTER AN ATTACK

### Protect your network against further breaches

Cisco's **Advance Malware Protection (AMP)** solution provides continuous detection and retrospective alerting, threat intelligence, advanced analytics and enterprise capabilities to proactively defend against, and respond to malware threats as they enter your network.

**Cisco and CDW  
TOGETHER WE'RE ALL  
YOUR NETWORK NEEDS**
